

I fretted about what AI means for my kids. So I built a model.

AI Workforce Sim · open source · every
assumption visible

saro-saravanan.github.io/ai-workforce-sim

THE PROBLEM

The headlines could not agree.

- Half of all jobs gone
 - Everyone richer
 - Nothing changes
 - Every number from somewhere I could not see
-

SO I MADE THE ASSUMPTIONS VISIBLE

A model, not a forecast.

-
- 19,000 task statements
-
- 831 occupations · 20 sectors
-
- 10 regions on one capability clock
-
- Every parameter sourced, ranged, and a lever

THE FRAMING

Every number is a difference.

-
- A world where AI keeps improving
-
- minus a world where it stopped in 2023
-
- Not a forecast of the level of jobs

THE HEADLINE · UNITED STATES · 2040

13.5M

fewer jobs than there would have been, out of 194 million. Most never posted, not lost.

THE HONEST PART

7 to 20M

the range, depending mostly on whether the gains are spent back into the economy

THIRTEEN QUESTIONS

The ones I could not answer at dinner.

-
- Will there be work for my grandchildren?
-
- Who pays first?
-
- Who keeps the gains?
-
- Will the capital pay back?
-
- Which businesses win, and which get competed away?
-

IT KEEPS SCORE

Checked every quarter against what has happened.

-
- Firm adoption
-
- Announced AI-cited job cuts
-
- AI industry revenue
-
- Data-centre spending
-
- Where it misses, it says so
-
